AB. . . a protein with a predicted molecular weight of 29,681. Comparisons
of the UL3, strain 333 ORF show essentially complete amino acid
identity with HSV-2 (strain HG52) and a 75% amino acid
identity with HSV type 1 (strain 17). To characterize the expression of
this gene, a hydrophilic region of the HSV-2 UL3 gene was cloned into a
bacterial expression vector. The resulting fusion protein was
used to generate antibodies in rabbits. In vitro translation of
HSV-2-derived mRNA followed by immunoprecipitation. . . remains the
same subsequent to DNase and RNase treatment, indicating that the UL3

protein product is not directly associated with nucleic acid.
